

Migrating from Pulp Installer to Single Container to Compose

Mike DePaulo
mikedep333

A farewell to the Pulp 3 Ansible Installer

Setup with Pulp Installer

- [Followed the pulp installer quickstart](#)
 - Added specific versions of pulp_file and pulp_rpm
 - Adapted command for connection=local & 127.0.0.1
- Create content from pulp_file docs' [sync script](#)

Migration to Single Container

- [Migration instructions](#)
- Also ...
 - See next slide

Migration to Single Container (continued)

- However:
 - Treating my F38 system as if it were EL8
 - Doing a workaround for downgrading postgres (remove LOCALE_PROVIDER)

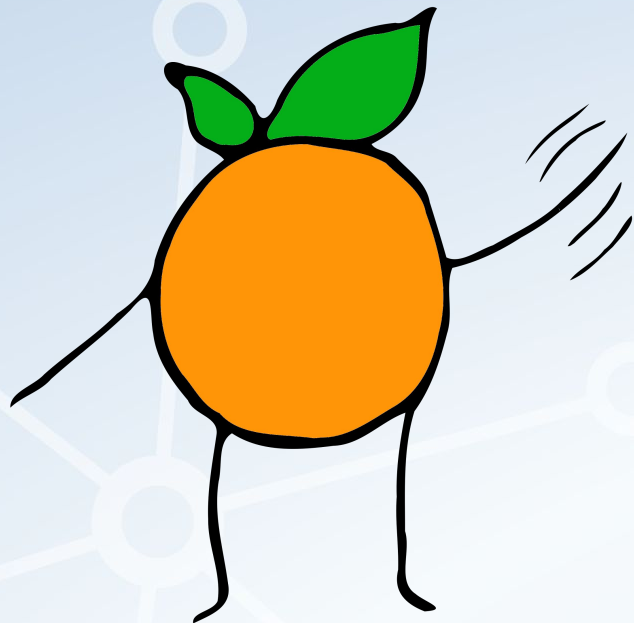

Migrate to Compose

- Being debugged currently, but the instructions are:
 - Reconfigure postgres for all hosts ([as seen in pulp installer migration docs](#))
 - `sudo dnf install podman-compose`
 - `cd images/compose`
 - `podman-compose -f compose.folders.yml up`

Shout-out to Pulp Operator

THANK YOU!
