

#### MHVLUG Monthly Meeting October 2015

### Understanding systemd

Patrick Ladd Technical Account Manager Red Hat Software pladd@redhat.com https://people.redhat.com/pladd

# #whatis TAM

- Premium named-resource support
- Proactive and early access
- Regular calls and on-site engagements
- Customer advocate within Red Hat and upstream
- Multi-vendor support coordinator
- High-touch access to engineering
- Influence for software enhancements
- NOT Hands-on or consulting

# What is systemd?

- Replaces init
  - Literally!

[root@rhel7 ~]# ls -al /sbin/init
lrwxrwxrwx. 1 root root 22 Jan 27 13:43 /sbin/init -> ../lib/systemd/systemd
[root@rhel7 ~]# ]

- First process to start and last to stop
- Parent process of all other processes
- Manages services and other resources

# What was init again?

- init System V UNIX origins in 1970s
- Process for starting system:

- BIOS/UEFI  $\rightarrow$  Bootloader  $\rightarrow$  Kernel  $\rightarrow$  init
- init is the parent of all processes
- Creates processes from scripts stored in /etc/inittab
- "Modern" init scripts are stored in /etc/init.d and called from /etc/rc\*

# Why replace System V init?

- init scripts!
  - Old, poorly maintained
  - Lack of standardization
  - Difficult / impossible to analyze (by humans and/or computers)
- Single threaded
- Unable to represent complex relationships

#### /etc/init.d/httpd (taken from RHEL 6.5, comments removed)

```
. /etc/rc.d/init.d/functions
if [ -f /etc/sysconfig/httpd ]; then
     . /etc/sysconfig/httpd
fi
HTTPD LANG=${HTTPD LANG-"C"}
INITLOG ARGS=""
apachectl=/usr/sbin/apachectl
httpd=${HTTPD-/usr/sbin/httpd}
prog=httpd
pidfile=${PIDFILE-/var/run/httpd/httpd.pid}
lockfile=${LOCKFILE-/var/lock/subsys/httpd}
RETVAL=0
STOP TIMEOUT=${STOP TIMEOUT-10}
start() {
    echo -n $"Starting $prog: "
    LANG=$HTTPD LANG daemon --pidfile=${pidfile} $httpd $OPTIONS
     RETVAL=$?
    echo
    [$RETVAL = 0] && touch ${lockfile}
    return $RETVAL
}
stop() {
     echo -n $"Stopping $prog: "
     killproc -p ${pidfile} -d ${STOP TIMEOUT} $httpd
     RETVAL=$?
    echo
     [ $RETVAL = 0  ] && rm -f ${lockfile} ${pidfile} 
}
```

#### /etc/init.d/httpd (continued)

```
reload() {
  echo -n $"Reloading $prog: "
  if ! LANG=$HTTPD LANG $httpd $OPTIONS -t >&/dev/null; then
     RETVAL=6
     echo $"not reloading due to configuration syntax error"
     failure $"not reloading $httpd due to configuration syntax error"
  else
     LSB=1 killproc -p ${pidfile} $httpd -HUP
     RETVAL=$?
     if [$RETVAL -eq 7]; then
       failure $"httpd shutdown"
    fi
  fi
  echo
}
case "$1" in
 start)
     start
     . .
     ,,
 stop)
     stop
     • •
     ,,
 status)
     status -p ${pidfile} $httpd
     RETVAL=$?
     . .
     ,,
```

### /etc/init.d/httpd (still continued...)

```
restart)
     stop
     start
     ..
 condrestart|try-restart)
     if status -p ${pidfile} $httpd >&/dev/null; then
          stop
          start
     fi
     ..
     ,,
 force-reload|reload)
     reload
     . .
 graceful|help|configtest|fullstatus)
     $apachectl $@
     RETVAL=$?
     ,,
 *)
     echo $"Usage: $prog {start|stop|restart|condrestart|try-restart|force-reload|reload|status|fullstatus|graceful|help|
configtest}"
     RETVAL=2
esac
exit $RETVAL
```

# systemd: httpd.service

[Unit] Description=The Apache HTTP Server After=remote-fs.target nss-lookup.target

[Service]

Type=notify EnvironmentFile=/etc/sysconfig/httpd ExecStart=/usr/sbin/httpd \$OPTIONS -DFOREGROUND ExecReload=/usr/sbin/httpd \$OPTIONS -k graceful ExecStop=/usr/sbin/httpd \$OPTIONS -k graceful-stop

KillSignal=SIGCONT PrivateTmp=true

[Install] WantedBy=multi-user.target

# So long, and thanks for all the fish

# Adoption

- Default init in
  - Fedora 15 May 2011
  - Arch October 2012
  - Red Hat June 2014
  - SUSE October 2014
  - Ubuntu & Debian April
    2015

# systemd -System & Service Manager

# systemd Overview

- Controls More than Services
- Dependency Control
- Tracks and Restarts Services
- Service Activation
- Faster Start Up and Shutdown
- Improved Resource Management
- Better Logging, Debugging and Profiling
- Backwards compatible
- Easier to learn

### systemd Units

Controls more than services, it controls all resources on the system - referred to as units.

Examples of Units:

Services	Sockets	Mounts
Targets	Swap	and more

Units are defined using Unit Files

• Naming convention is name.unit\_type

# systemd Unit Files

- Maintainer files: /usr/lib/systemd/system
- Administrator files: /etc/systemd/system
- •Non-persistent, runtime data: /run/systemd
- Drop-ins: /etc/systemd/system/[name.type].d/\*.conf

Note: unit files under /etc will take precedence over /usr

Don't forget `systemctl daemon-reload` when modifying units.

# **Common Unit File Options**

- **Description=Unit description**
- **Documentation=Documentation links**
- Requires=Additional units required
- Before/After=Unit must start Before/After
- Wants=Weaker Requires
- Conflicts=Units cannot co-exist
- WantedBy/RequiredBy=Set other units requirement
- Lots of great detail in the RHEL 7 System Administrator's Guide

### **Service Activation**

- Start up services when needed
  - Save resources
  - Increased reliability
  - Transparent to client
- Activation by Socket, Device, Path, Bus, and Timer
- Recommended to convert xinetd services to units

# Improved Resource Management

- Services labeled and isolated with Cgroups
- More control than nice alone

- Can properly kill/restart entire service chain
- Can configure multiple instances for a single service
- Can balance by shares or by hard limits

- Tracked in the kernel
- Knows all children
- Don't need to rely on a potentially misbehaving process to hopefully kill its children

# Auto-Restarting

- It's paying attention!
- Reality: software does crash occasionally
- Reduces need for manual intervention
- Socket stays open, only lose that single transaction

# systemd: Managing Services

#### With init:

\$ service unit {start,stop,restart,reload}

With systemd:

\$ systemctl {start, stop, restart, reload} unit1 [unit2 ...]

- Allows multiple services to be acted on simultaneously
- Assumes .service as unit type
- Tab completion works great with systemctl
  - Install bash-completion

### systemctl vs service

<pre>[root@rhel6 ~]# service hellod start</pre>	-		
Starting Hello Server:	Ĺ	0K	
<pre>[root@rhel6 ~]# service hellod status</pre>			
hellod (pid 2889) is running			
<pre>[root@rhel6 ~]# service hellod stop</pre>			
Stopping Hello Server:	[	0K	]
[root@rhel6 ~]#			

```
[root@rhel7 ~]# systemctl start hellod.service
[root@rhel7 ~]# systemctl status hellod.service
hellod.service - Hello Service
Loaded: loaded (/etc/systemd/system/hellod.service; enabled)
Active: active (running) since Tue 2015-02-17 18:29:25 EST; 5s ago
Process: 3941 ExecStart=/usr/local/sbin/hellod (code=exited, status=0/SUCCESS)
Main PID: 3943 (hellod)
CGroup: /system.slice/hellod.service
____3943 /usr/local/sbin/hellod
Feb 17 18:29:25 rhel7.mruzicka systemd[1]: Starting Hello Service...
Feb 17 18:29:25 rhel7.mruzicka systemd[1]: Started Hello Service.
[root@rhel7 ~]# systemctl stop hellod.service
[root@rhel7 ~]#
```

### systemctl vs service

#### • List services:

[root@rhel6 ~]# service --status-all abrt-ccpp hook is installed abrtd (pid 1652) is running... abrt-dump-oops is stopped acpid (pid 1440) is running... atd (pid 1675) is running... auditd (pid 1106) is running... automount (pid 1518) is running... certmonger (pid 1704) is running... Stopped cgred is stopped

<pre>[root@rhel7 ~]# systemctl</pre>	type se	ervicestate	active
UNIT	LOAD	ACTIVE SUB	DESCRIPTION
abrt-ccpp.service	loaded	active exited	Install ABRT coredump hook
abrt-oops.service	loaded	active running	g ABRT kernel log watcher
abrt-xorg.service	loaded	active running	g ABRT Xorg log watcher
abrtd.service	loaded	active running	g ABRT Automated Bug Reporting
accounts-daemon.service		active running	
alsa-state.service	loaded	active running	g Manage Sound Card State (res

### Managing Services: Enable / Disable

### With init:

\$ chkconfig unit {on,off}

With systemctl:

\$ systemctl {enable, disable, mask, unmask} unit [unit...]

mask — "This will link these units to /dev/null, making it impossible to start them. This is a stronger version of disable, since it prohibits all kinds of activation of the unit, including manual activation. Use this option with care."

# Systemctl vs chkconfig

#### List all services:

<pre>[root@rhel6 ~]#</pre>	chkconfi	iglist	-					
abrt-ccpp	0:off	1:off	2:off	3:on	4:off	5:on	6:off	
abrtd	0:off	1:off	2:off	3:on	4:off	5:on	6:off	
acpid	0:off	1:off	2:on	3:on	4:on	5:on	6:off	
atd	0:off	1:off	2:off	3:on	4:on	5:on	6:off	
auditd	0:off	1:off	2:on	3:on	4:on	5:on	6:off	
autofs	0:off	1:off	2:off	3:on	4:on	5:on	6:off	
blk-availability	/	0:off	1:on	2:on	3:on	4:on	5:on	6:off
certmonger	0:off	1:off	2:off	3:on	4:on	5:on	6:off	

<pre>[root@rhel7 ~]# systemctl list-unit-files</pre>	
UNIT FILE	STATE
abrt-ccpp.service	enabled
abrt-oops.service	enabled
abrt-pstoreoops.service	disabled
abrt-vmcore.service	enabled
abrt-xorg.service	enabled
abrtd.service	enabled
accounts-daemon.service	enabled
alsa-restore.service	static
alsa-state.service	static

### systemctl

#### Lots of options...

<pre>[root@rhel7 ~]# system</pre>	nctl	
cancel	is-active	reload-or-restart
condreload	is-enabled	reload-or-try-restart
condrestart	is-failed	rescue
condstop	isolate	reset-failed
daemon-reexec	kexec	restart
daemon-reload	kill	set-default
default	link	set-environment
delete	list-dependencies	set-property
disable	list-jobs	show
emergency	list-sockets	show-environment
enable	list-unit-files	snapshot
exit	list-units	start
force-reload	mask	status
get-default	poweroff	stop
halt	preset	suspend
help	reboot	try-restart
hibernate	reenable	unmask
hybrid-sleep	rel <u>o</u> ad	unset-environment

# systemd-\*

#### Lots of new commands...

<pre>[root@rhel7 ~]# systemd-</pre>	
systemd-analyze	systemd-loginctl
systemd-ask-password	systemd-machine-id-setup
systemd-cat	systemd-notify
systemd-cgls	systemd-nspawn
systemd-cgtop	systemd-run
systemd-coredumpctl	systemd-stdio-bridge
systemd-delta	systemd-sysv-convert
systemd-detect-virt	systemd-tmpfiles
systemd-inhibit	systemd-tty-ask-password-agent

# systemd Dependencies

- Define order and requirements for each unit
- Example: nfs-lock.service

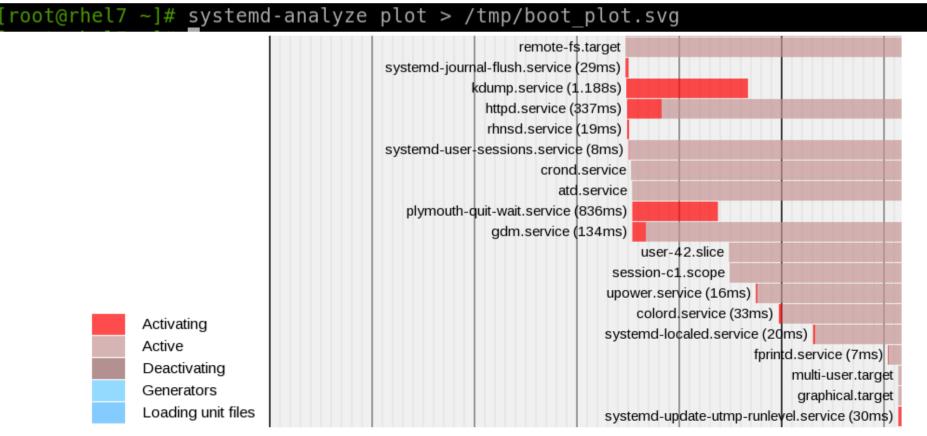

Requires=rpcbind.service network.target After=network.target named.service rpcbind.service Before=remote-fs-pre.target

• No more semi-arbitrary 00-99 ASCII order loading

## Parallel, Not Serial

- Allows for Faster Start Up and Shutdown
- Efficiently Use System Resources

### **Boot Process**

• Boot path determined by default.target

### Let's track it backwards!

[root@rhel7 ~]# systemctl get-default
graphical.target\_

#### [root@rhel7 ~]# grep -v '^#' /usr/lib/systemd/system/graphical.target

[Unit] Description=Graphical Interface Documentation=man:systemd.special(7) Requires=multi-user.target After=multi-user.target Conflicts=rescue.target Wants=display-manager.service AllowIsolate=yes

• graphical.target requires multi-user.target...

[root@rhel7 ~]# grep -v '^#' /usr/lib/systemd/system/multi-user.target

[Unit] Description=Multi-User System Documentation=man:systemd.special(7) Requires=basic.target Conflicts=rescue.service rescue.target After=basic.target rescue.service rescue.target AllowIsolate=yes

### **Boot Process**

• Which requires basic.target...

[root@rhel7 ~]# grep -v '^#' /usr/lib/systemd/system/basic.target

[Unit] Description=Basic System Documentation=man:systemd.special(7) Requires=sysinit.target Wants=sockets.target timers.target paths.target slices.target After=sysinit.target sockets.target timers.target paths.target slices.target

• Which requires sysinit.target...

[root@rhel7 ~]# grep -v '^#' /usr/lib/systemd/system/sysinit.target

[Unit] Description=System Initialization Documentation=man:systemd.special(7) Conflicts=emergency.service emergency.target Wants=local-fs.target swap.target After=local-fs.target swap.target emergency.service emergency.target

### Which wants local-fs-pre.target and swap.target...

[root@rhel7 ~]# grep -v '^#' /usr/lib/systemd/system/local-fs-pre.target

[Unit] Description=Local File Systems (Pre) Documentation=man:systemd.special(7) RefuseManualStart=yes [root@rhel7 ~]# grep -v '^#' /usr/lib/systemd/system/swap.target [Unit]

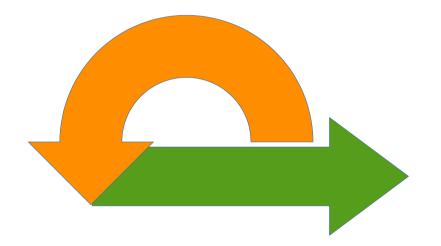

Description=Swap Documentation=man:systemd.special(7) [root@rhel7 ~]#

• End of the line!

Targets then loaded from the beginning..

But, how does this work for starting individual services?

### Boot Process – Services/Units

• Target "Wants" Directories:

/usr/lib/systemd/system/<name>.target.wants/ /etc/systemd/system/<name>.target.wants/

- Files are symlinks to actual unit files
- Empty target wants directories are placeholders

### **Boot Process - Services/Units**

#### Example for multi-user.target.wants:

<pre>[root@rhel7 ~]# ls /usr/lib/systemd/system/multi-user.target.wants brandbot.path plymouth-quit.service systemd-logind.service dbus.service plymouth-quit-wait.service systemd-user-sessions.service</pre>				
	d-ask-password-wall.path			
	tc/systemd/system/multi-			
abrt-ccpp.service	hypervkvpd.service	postfix.service		
abrtd.service	hypervvssd.service	remote-fs.target		
abrt-oops.service	irqbalance.service	rhsmcertd.service		
abrt-vmcore.service	kdump.service	rngd.service		
abrt-xorg.service	ksm.service	rsyslog.service		
atd.service	ksmtuned.service	smartd.service		
auditd.service	libstoragemgmt.service	sshd.service		
avahi-daemon.service	libvirtd.service	sysstat.service		
chronyd.service	mariadb.service	tuned.service		
crond.service	mdmonitor.service	vmtoolsd.service		
cups.path	ModemManager.service			
httpd.service	NetworkManager.service			

### **Exploring dependencies**

#### List all services by target:

root@rhel7 ~]# systemctl list-dependencies multi-user.target --no-pager multi-user.target -abrt-ccpp.service -abrt-oops.service -abrt-vmcore.service -basic.target -alsa-restore.service -alsa-state.service -paths.target -slices.target --.slice └─system.slice -sockets.target -avahi-daemon.socket -cups.socket -timers.target └─systemd-tmpfiles-clean.timer -getty.target -getty@tty1.service remote-fs.target

# **Analyzing Boot**

#### • Each unit is tracked during start up

#### [root@rhel7 ~]# systemd-analyze blame --no-pager

2.598s mariadb.service 1.459s kdump.service

868ms plymouth-quit-wait.service

867ms postfix.service

510ms firewalld.service

397ms network.service

380ms httpd.service

347ms boot.mount

311ms tuned.service

245ms lvm2-monitor.service

237ms libvirtd.service

232ms accounts-daemon.service

203ms systemd-vconsole-setup.service

203ms ModemManager.service

168ms avahi-daemon.service

167ms systemd-logind.service

156ms rtkit-daemon.service

127ms chronyd.service

### Targets are the new Runlevels

#### Targets != Runlevels – some equivalency

Traditional Runlevel	Equivalent Target	Symlink Target
Runlevel 0	poweroff.target	runlevel0.target
Runlevel 1	rescue.target	runlevel1.target
Runlevel 2	multi-user.target	runlevel2.target
Runlevel 3	multi-user.target	runlevel3.target
Runlevel 4	multi-user.target	runlevel4.target
Runlevel 5	graphical.target	runlevel5.target
Runlevel 6	reboot.target	runlevel6.target

• Targets can and will contain other targets

### **Common Targets**

Target	Purpose
graphical.target	Supports multiple users, graphical and text-based logins
multi-user.target	Supports multiple users, text-based logins only
rescue.target	Single user, local file systems mounted and basic system initialization completed, networking is not activated
emergency.target	Single user, root file system is mounted read-only, only a few essential services are started, networking is not activated

• Rescue and Emergency require root password!

# Working with Targets

Viewing the default target:

[root@rhel7 ~]# systemctl get-default
multi-user.target
[root@rhel7 ~]#

#### Setting default target:

[root@rhel7 ~]# systemctl set-default graphical.target
rm '/etc/systemd/system/default.target'
ln -s '/usr/lib/systemd/system/graphical.target' '/etc/systemd/system/default.ta
rget'
[root@rhel7 ~]#

Default target is just a symlink:

[root@rhel7 ~]# ls -al /etc/systemd/system/default.target lrwxrwxrwx. 1 root root 40 Feb 22 21:17 /etc/systemd/system/default.target -> /u sr/lib/systemd/system/graphical.target [root@rhel7 ~]#

# Working with Targets

#### Changing currently loaded target:

[root@rhel7 ~]# systemctl isolate graphical.target
[root@rhel7 ~]#

#### Changing to rescue mode:

[root@rhel7 ~]# systemctl rescue

Broadcast message from mruzicka@rhel7.mruzicka on pts/0 (Sat 2015-02-14 19:48:43 EST):

The system is going down to rescue mode NOW!

Changing to emergency mode without sending message:

[root@rhel7 ~]# systemctl --no-wall emergency

# Working with Targets

View list of currently loaded targets:

#### [root@rhel7 ~]# systemctl list-units --type target

#### Results pipe to less by default: (can use --no-pager)

UNIT	LOAD	ACTIVE	SUB	DESCRIPTION
basic.target	loaded	active	active	Basic System
cryptsetup.target	loaded	active	active	Encrypted Volumes
getty.target	loaded	active	active	Login Prompts
local-fs-pre.target	loaded	active	active	Local File Systems (Pre)
local-fs.target	loaded	active	active	Local File Systems
multi-user.target	loaded	active	active	Multi-User System
network.target	loaded	active	active	Network
paths.target	loaded	active	active	Paths
remote-fs.target	loaded	active	active	Remote File Systems
slices.target	loaded	active	active	Slices
<pre>sockets.target</pre>	loaded	active	active	Sockets
sound.target	loaded	active	active	Sound Card
swap.target	loaded	active	active	Swap
lines 1-14/23 61%				

# Shutting Down, Suspending, Etc.

Old Command	New Command	Description
halt	systemctl halt	Halts the system
poweroff	systemctl poweroff	Powers off the system
reboot	systemctl reboot	Restarts the system
pm-suspend	systemctl suspend	Suspends the system
pm-hibernate	systemctl hibernate	Hibernates the system
pm-suspend-hybrid	systemctl hybrid-sleep	Hibernates and suspends the system

[root@rhel7 ~]# ls -al /usr/sbin/shutdown
[rwxrwxrwx. 1 root root 16 Feb 13 17:00 /usr/sbin/shutdown -> ../bin/systemctl
[root@rhel7 ~]#

Step 1: Reboot your system

Step 2: When the GRUB2 boot loader menu appears, press any key to interrupt, and press 'e' to edit selection

Red Hat Enterprise Linux Server 7.1 (Maipo), with Linux 3.10.0-229.el7.x→ Red Hat Enterprise Linux Server 7.1 (Maipo), with Linux 0-rescue-801addf→

Use the 1 and  $\downarrow$  keys to change the selection. Press 'e' to edit the selected item, or 'c' for a command prompt.

Step 3: Using the cursor keys, navigate to the end of the line that starts with linux16

Step 4: Append 'rd.break' to the end of the line and press Ctrl-X to boot modified config

```
insmod part_msdos
        insmod xfs
        set root='hd0,msdos1'
        if [ x$feature platform search hint = xy ]; then
          search --no-floppy --fs-uuid --set=root --hint='hd0,msdos1'
                                                                       dfa2f4cN
e-ab99-4e78-bc96-ebb73fa2922c
        else
          search -- no-floppy -- fs-uuid -- set=root dfa2f4ce-ab99-4e78-bc96-ebb7\
3fa2922c
        fi
      linux16 /vmlinuz-3.10.0-229.el7.x86_64 root=/dev/mapper/rhel_rhel7-rooN
t ro_crashkernel=auto_rd.lvm.lv=rhel_rhel7/root_rd.lvm.lv=rhel_rhel7/swap_rhgbN
quiet LANG=en_US.UTF-8 rd.break
        initrd16 /initramfs-3.10.0-229.el7.x86_64.img
     Press Ctrl-x to start, Ctrl-c for a command prompt or Escape to
      discard edits and return to the menu. Pressing Tab lists
      possible completions.
```

Step 6: At the switch\_root prompt, remount the /sysroot file system read-write, then use chroot to enter the jail

Step 7: Reset the root password with passwd

Generating "/run/initramfs/rdsosreport.txt"

Entering emergency mode. Exit the shell to continue. Type "journalctl" to view system logs. You might want to save "/run/initramfs/rdsosreport.txt" to a USB stick or /boot after mounting them and attach it to a bug report.

switch\_root:/# mount -oremount,rw /sysroot switch\_root:/# chroot /sysroot sh-4.2# passwd root Changing password for user root. New password:

**IMPORTANT!** (Because you're using SELinux, right?)

Step 8: Instruct SELinux to relabel all files upon reboot.

• System may not boot properly if skipped!

Step 9: Exit twice to initiate relabel and reboot

**NOTE:** The relabel may take quite a while to run before the system becomes available.

### systemd-cgtop

#### Show top control groups by their resource usage:

<pre>[root@rhel7 ~]# systemd-cgtop</pre>					
Path	Tasks	%CPU	Memory	Input/s	Output/s
/	453	20.9	19.3G	0B	11.8K
/machine.slice	-	2.7	132.1M	-	-
/machine.slitance\x2d00000017.scope	2	2.7	132.1M	-	-
/machine.sli00000017.scope/emulator	2	2.7	-	-	-
/machine.slix2d00000017.scope/vcpu0	1	0.0			-
/system.slice/auditd.service	1				-
/system.slice/avahi-daemon.service	2	-	-	-	-

#### • May need to enable accounting — nerfect dron-[root@rhel7 ~]# vi /etc/systemd/system/mariadb.service.d/accounting.conf

[Service] CPUAccounting=1 MemoryAccounting=1 BlockAccounting=1

### systemd-cgls

#### Recursively show control group contents:

[root@rhel7 ~]# systemd-cgls

—1 /usr/lib/systemd/systemd --switched-root --system --deserialize 23 —user.slice |-user-1000.slice |-session-2.scope | | - 311 -bash | | -2830 sshd: mruzicka [priv | | -2866 sshd: mruzicka@pts/1 | | -2867 -bash

└─system.slice /─systemd-localed.service / └─1810 /usr/lib/systemd/systemd-localed /─colord.service / └─1644 /usr/libexec/colord /─upower.service / └─1145 /usr/libexec/upowerd /─polkit.service / └─680 /usr/lib/polkit-1/polkitd --no-debug

# systemd Logging: journalctl

# Improved Logging

- Don't need to wait for syslog to start
- No More Losing STDERR and STDOUT
- More detail than classic syslog alone
- Logging with metadata
- Improved debugging and profiling

- Does not replace rsyslog in RHEL 7
  - rsyslog is enabled by default
- The journal is not persistent by default.
  - Enable persistence: `mkdir /var/log/journal`
- Stored in key-value pairs
  - journalctl [tab] [tab]
  - Man 7 systemd.journal-fields
- Collects event metadata along with the message
- Simple to filter
  - Interleave units, binaries, etc.

# Using the Journal

- Tail the journal: `journalctl -f`
- Show X number of lines: `journalctl -n 50`
- View from boot: `journalctl -b`
- Filter by priority: `journalctl -p [level]`

0	emerg
1	alert
2	crit
3	err
4	warning
5	notice
6	debug

#### View basic logs:

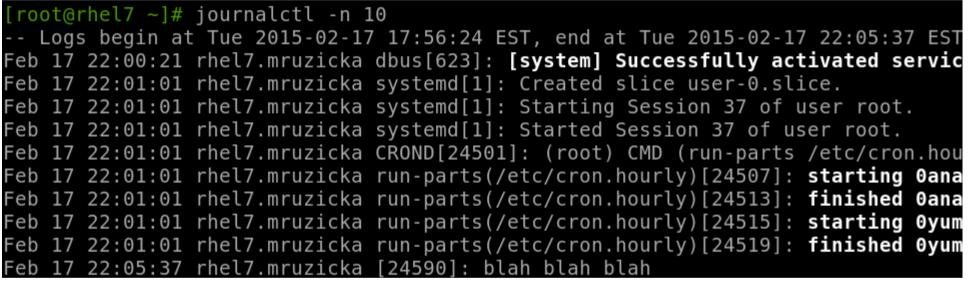

#### [root@rhel7 ~]# journalctl

- Time stamps converted to system local time zone
- All logged data is shown, including rotated logs
- Non-persistent by default, can be preserved

#### View most recent logs: (-f to follow)

 Can force stdout/stderr to write to journal with systemd-cat if wanted

[root@rhel7 ~]# systemd-cat echo 'blah blah'

#### Filter by priority:

[root@rhel7 ~]# journalctl -p err
-- Logs begin at Tue 2015-02-17 17:56:24 EST, end at Tue 2015-02-17 22:10:01 EST
Feb 17 17:56:24 rhel7.mruzicka kernel: Failed to access perfctr msr (MSR c1 is 0
Feb 17 17:56:25 rhel7.mruzicka systemd[1]: /usr/lib/systemd/system-generators/an

#### Filter by time and priority:

[root@rhel7 ~]# journalctl -p err --since "2015-2-17 18:00:00" --until "2015-2-1
7 18:10:00"
-- Logs begin at Tue 2015-02-17 17:56:24 EST, end at Tue 2015-02-17 22:10:01 EST
Feb 17 18:00:57 rhel7.mruzicka systemd[3163]: Failed at step EXEC spawning /usr/
Feb 17 18:00:57 rhel7.mruzicka systemd[1]: Failed to start Hello Service.

• Advanced filtering by field, UID, unit, etc..

# Using journalctl

- Other useful filters:
  - -r reverse order
  - -u [unit]
  - binary e.g. /usr/sbin/dnsmasq [additional binaries]
  - --since=yesterday or YYYY-MM-DD (HH:MM:SS)
  - --until=YYYY-MM-DD
- View entire journal
  - journalctl -o verbose (useful for grep)

# systemd - Review

- Replaces init and does much more
- It is here and it's powerful
- New boot and root password reset process
- New commands and functionality
- Plenty of great information and resources available

### Start using the new commands

Bash Completion is your friend!

- # yum install bash-completion

#### systemd Cheat Sheet for Red Hat Enterprise Linux 7

**Common Administrative Commands in RHEL 5, 6, & 7** 

• https://access.redhat.com/articles/1189123

# Compatibility

- Systemd maintains 99% backwards compatibility with LSB compatible initscripts and the exceptions are well documented.
- While we do encourage everyone to convert legacy scripts to service unit files, it's not a requirement.
- Incompatibilities are listed here: http://www.freedesktop.org/wiki/Software/systemd/Incompatibilities/
- Converting SysV Init Scripts: http://0pointer.de/blog/projects/systemd-for-admins-3.html
