# Red Hat Enterprise Linux 6 Security Feature Overview

Steve Grubb

Principal Engineer, Red Hat

June 23, 2010

**SUMMIT**

JBoss  
WORLD

PRESENTED BY RED HAT

# Overview

- Minimal Platform Install
- Libcap-ng
- OpenSCAP
- FIPS-140
- Stronger Hashes
- Common Criteria

**SUMMIT**

**JBoss  
WORLD**

PRESENTED BY RED HAT

# Minimal Platform Install

- Goals
  - Reduce Attack Surface
  - Minimize package count
  - Add back things needed for secure operation
    - Need to be able to disable services
    - Cron jobs for maintenance
    - Mail delivery for cron jobs
    - Update packages
    - Iptables, audit, and sshd

# Minimal Platform Install

**RED HAT  
ENTERPRISE LINUX 5**

The default installation of Red Hat Enterprise Linux Server includes a set of software applicable for general internet usage. What additional tasks would you like your system to include support for?

- Software Development
- Virtualization
- Web server

You can further customize the software selection now, or after install via the software management application.

Customize later     Customize now

# Minimal Platform Install

**SUMMIT**

**JBoss  
WORLD**

**PRESENTED BY RED HAT**

# Minimal Platform Install

RHEL5 (5.5 used for testing)

- Packages - 879
- Setuid - 33
- Setgid - 11
- Daemons - 44
- Networked services - 18
- Space – 2.2 Gb
- Notes: Boots into X even though no packages checked

**SUMMIT**

**RED HAT ENTERPRISE LINUX 5**

**Desktop Environments**  
**Applications**  
**Development**  
**Servers**  
**Base System**  
**Virtualization**  
**Languages**

**Administration Tools**  
 **Base**  
 **Dialup Networking Support**  
 **Java**  
 **Legacy Software Support**  
 **OpenFabrics Enterprise Distribut**  
 **System Tools**

This group is a collection of graphical administration tools for the system, such as for managing user accounts and configuring system hardware.

# Minimal Platform Install

RHEL5 (5.5 used for testing)

- Packages - 437
- Setuid - 29
- Setgid - 9
- Daemons - 39
- Networked services – 16
- Space – 1006 Mb
- Notes: Boots to runlevel 3

**SUMMIT**

PRESENTED BY RED HAT

# Minimal Platform Install

**RED HAT®  
ENTERPRISE LINUX® 6**

The default installation of Red Hat Enterprise Linux is a basic server install. You can optionally select a different set of software now.

virtualhost  
 Desktop  
 Software Development Workstation  
 Minimal

Please select any additional repositories that you want to use for software installation.

HighAvailability  
 LargeFileSystem  
 LoadBalance  
 Red Hat Enterprise Linux

You can further customize the software selection now, or after install via the software management application.

## RHEL6 (pre-beta2)

- Packages - 226
- Setuid - 20
- Setgid - 7
- Daemons - 13
- Networked services – 5
- Space – 565 Mb
- Notes: Boots to runlevel 3 very quickly

# Minimal Platform Install - Summary

	Packages	Setuid	Setgid	Daemons	Network Services	Space
RHEL5	879	33	11	44	18	2200
RHEL5 base	437	29	9	39	16	1006
RHEL6	226	20	7	13	5	565

# Libcap-ng

- Posix Capabilities are in the Linux kernel in an attempt to make minimal privilege applications. Few examples:
  - CAP\_CHOWN - this overrides the restriction of changing file ownership and group ownership.
  - CAP\_NET\_RAW - Allow use of RAW sockets, allow use of PACKET sockets.
  - CAP\_NET\_BIND\_SERVICE - Allows binding to TCP/UDP sockets below 1024.
- Model consists of: Effective, Permitted, Inheritable, and Bounding Set.

# Libcap-ng

- RHEL5
  - No file system based capabilities
  - Bounding set was system wide
    - Defined as !CAP\_SETPCAP
    - Intended use was to prevent module loading after boot
  - Process could drop capabilities & only inheritable capabilities are passed to child processes

# Libcap-ng

- RHEL6
  - Adds file system based capabilities
  - Bounding set is per thread
    - Intended use was for containers or jails
    - Threads can remove capabilities from bounding set
  - Now, processes that drop capabilities and have uid 0 can regain all capabilities on `execve()`

# Libcap-ng

- File system based capabilities
  - You can set effective & inheritable
  - pam\_cap.so can be used to add capabilities to process tree by setting permitted
  - Combining these, its possible to construct a system that allows one user but not another be able to do certain things.

# Libcap-ng

- Wanted to reduce attack surface for RHEL6
- Dropping capabilities can be used to make root daemons less powerful
- Libcap is tedious to use
  - Changing uid while retaining capabilities takes about 60 lines of code
- RHEL6 kernel has bounding set, which is not addressed by libcap

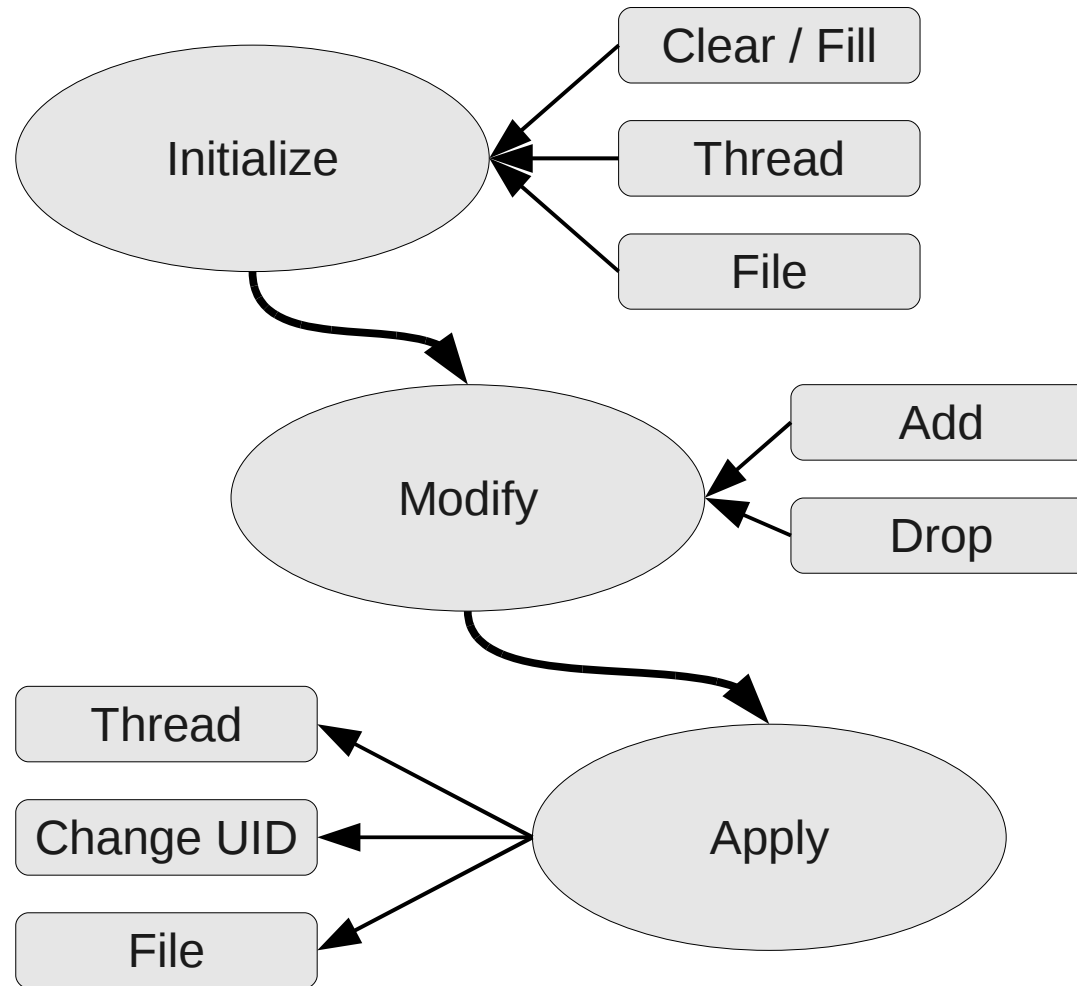

# Libcap-ng

- Use Cases:
  - Drop all capabilities
  - Keep one capability
  - Keep several capabilities
  - Check if you have any capabilities
  - Check for certain capabilities
  - Retain capabilities across a uid change

# Libcap-ng

**SUMMIT**

**JBoss  
WORLD**

PRESENTED BY RED HAT

# Libcap-ng

- Keep one capability

```
capng_clear(CAPNG_SELECT_BOTH);  
capng_update(CAPNG_ADD, CAPNG_EFFECTIVE|CAPNG_PERMITTED, CAP_CHOWN);  
capng_apply(CAPNG_SELECT_BOTH);
```

- Check if you have any capabilities

```
if (capng_have_capabilities(CAPNG_SELECT_CAPS) > CAPNG_NONE)  
    do_something();
```

- Retain capabilities across a uid change

```
capng_clear(CAPNG_SELECT_BOTH);  
capng_update(CAPNG_ADD, CAPNG_EFFECTIVE|CAPNG_PERMITTED, CAP_CHOWN);  
if (capng_change_id(99, 99, CAPNG_DROP_SUPP_GRP | CAPNG_CLEAR_BOUNDING))  
    error();
```

**SUMMIT**

**JBoss  
WORLD**

PRESENTED BY RED HAT

# Libcap-ng

- New tools to check apps:
  - Pscap – lists all applications with capabilities
  - Netcap – list all networked apps with capabilities
  - Filecap – display or set file based capabilities
- We dropped capabilities in a number of daemons to reduce the attack surface.
- We changed file permissions on important things to require `CAP_DAC_OVERRIDE` to write to it.

# Libcap-ng

```
[root ~]# netcap
ppid  pid  acct  command  type  port  capabilities
1     1765 nobody  dnsmasq  tcp   53    net_admin, net_raw +
1     1652 root   sshd     tcp   22    full
1     1449 root   cupsd   tcp   631   full
1     1652 root   sshd     tcp6  22    full
1     1449 root   cupsd   tcp6  631   full
1     1449 root   cupsd   udp   631   full
1     8515 root   vpnc    udp   4500  full
1     1765 nobody dnsmasq  udp   53    net_admin, net_raw +
1     1765 nobody dnsmasq  udp   67    net_admin, net_raw +
```

# OpenSCAP

- SCAP – Security Content Automation Protocol
- Assist users with configuring IT systems
- Used to automate:
  - Configuring systems
  - Verifying system hasn't changed
  - Verifying a vulnerability
  - Response to new threat

**SUMMIT**

**JBoss  
WORLD**

PRESENTED BY RED HAT

# OpenSCAP

- Suite of Standards

- Extensible Configuration Checklist Description Format XCCDF
- Open Vulnerability and Assessment Language OVAL
- Common Platform Enumeration CPE
- Common Vulnerabilities and Exposures CVE
- Common Configuration Enumeration CCE
- Common Vulnerability Scoring System CVSS

**SUMMIT**

**JBoss  
WORLD**

PRESENTED BY RED HAT

# OpenSCAP

Remembering the acronyms	
What IT systems do I have in my Enterprise?	CPE
What vulnerabilities do I need to worry about?	CVE
What vulnerabilities do I need to worry about right now?	CVSS
How do I configure my systems securely?	CCE
How do I define a policy of secure configurations?	XCCDF
How can I be sure my systems conform to policy?	OVAL

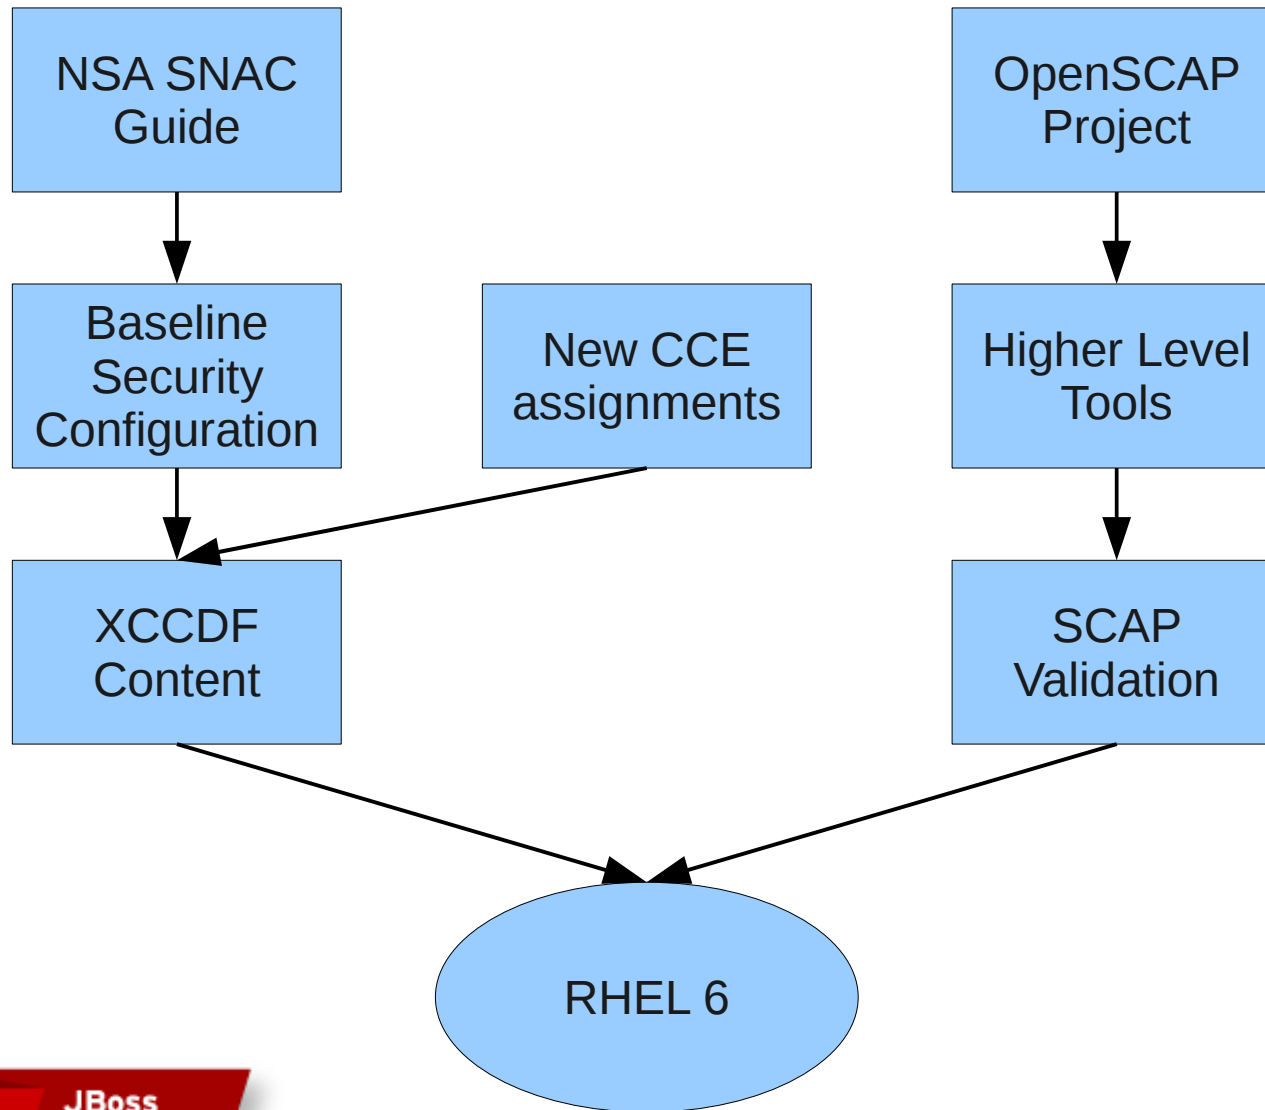

**SUMMIT**

# OpenSCAP

**SUMMIT**

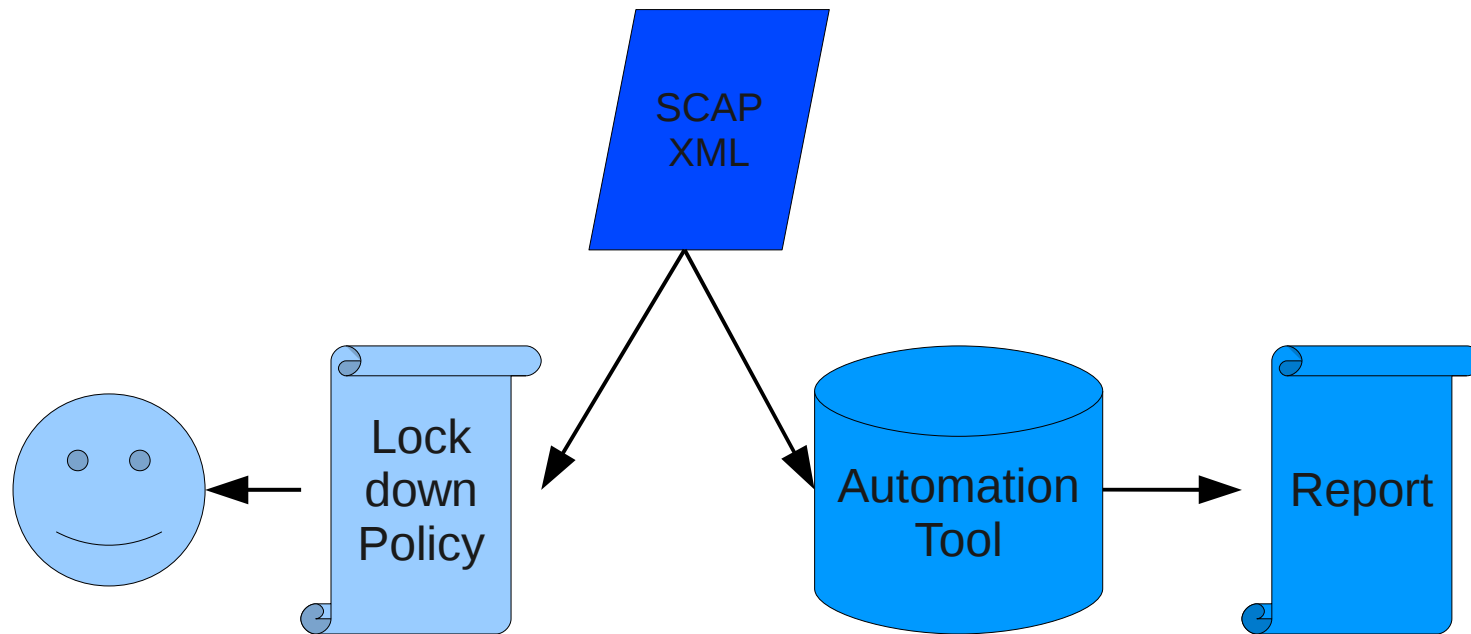

JBoss  
WORLD

PRESENTED BY RED HAT

# OpenSCAP

SCAP allows the creation of text checklists as well as system reports.

**SUMMIT**

**JBoss  
WORLD**

PRESENTED BY RED HAT

# OpenSCAP

- Open source library
- Free to integrate under LGPL
- Cross Platform
- Multiple languages supported
- Unicode tested
- SE Linux friendly design
- Easily extended to new platforms with plugins

**SUMMIT**

**JBoss  
WORLD**

PRESENTED BY RED HAT

# OpenSCAP

- Project Goals
  - Make the standards easier to implement through open source libraries and code samples.
  - Work with tool communities to build SCAP standards and models into their offerings.
- Barriers to writing SCAP tools
  - OVAL ~400 pages
  - XCCDF 132 pages
  - Certification

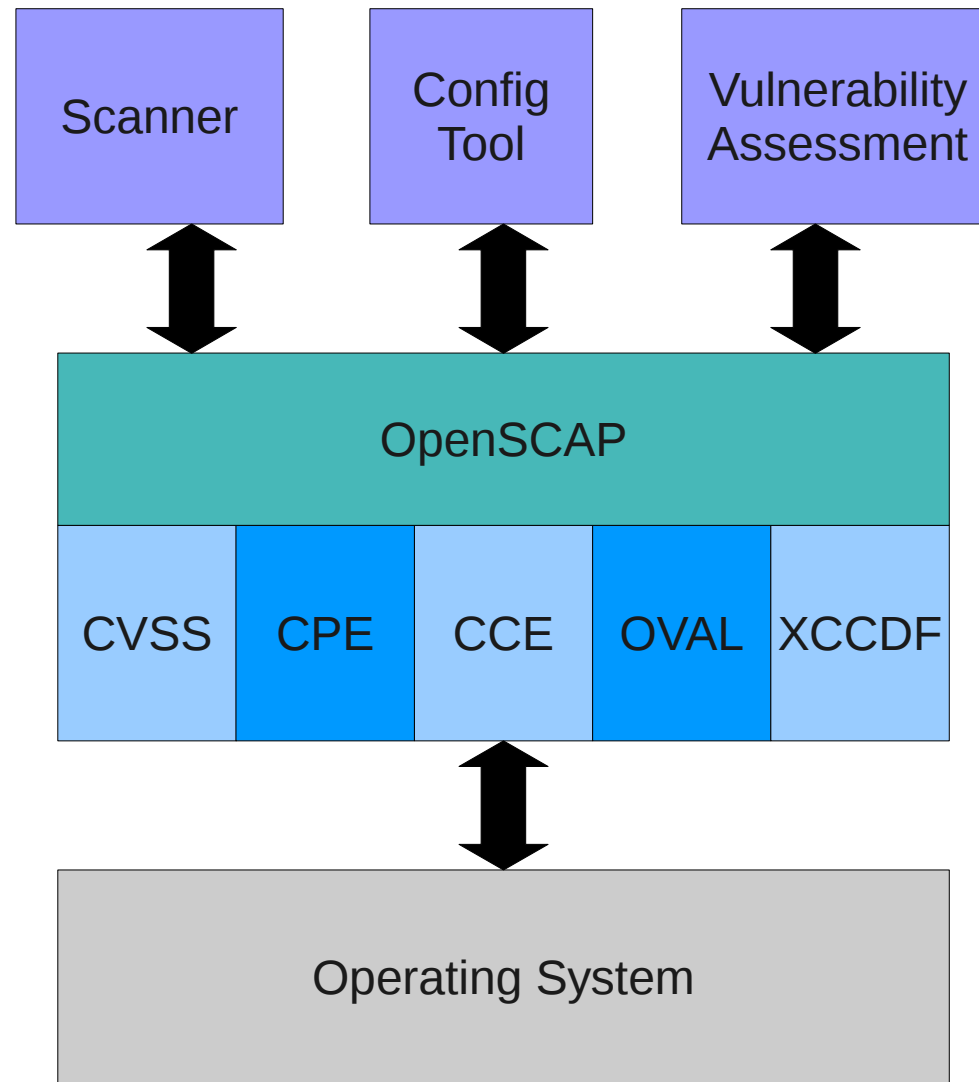

**SUMMIT**

**JBoss  
WORLD**

PRESENTED BY RED HAT

# OpenSCAP

**SUMMIT**

**JBoss  
WORLD**

PRESENTED BY RED HAT

# OpenSCAP

- XCCDF to Kickstart
- XCCDF to Puppet
- Policy Editors
- System Integrity Scanning
  - At bootup
  - At network connect
  - During VM startup
- Adhoc query tool
- Systems Management Integration

**SUMMIT**

**JBoss  
WORLD**

PRESENTED BY RED HAT

# Stronger Hashes

- MD5 was being used in many places for integrity or password hashes
- Attacks against MD5 have been getting better
- NIST's Policy on Hash Functions:
  - Federal agencies should stop using SHA-1 for digital signatures, digital time stamping and other applications that require collision resistance as soon as practical, and must use the SHA-2 family of hash functions for these applications after 2010.
- Needed to adjust all tools that touch software from source code to system verification.

# Stronger Hashes

- Shadow-utils, glibc, pam, authconfig were done during RHEL5
- Started Project for Fedora 11. Changed:
  - Rpm, koji, spacewalk/satellite, yum, createrepo, punji, RHN, yaboot
- To do:
  - Changes for grub password hash expected in 6.1

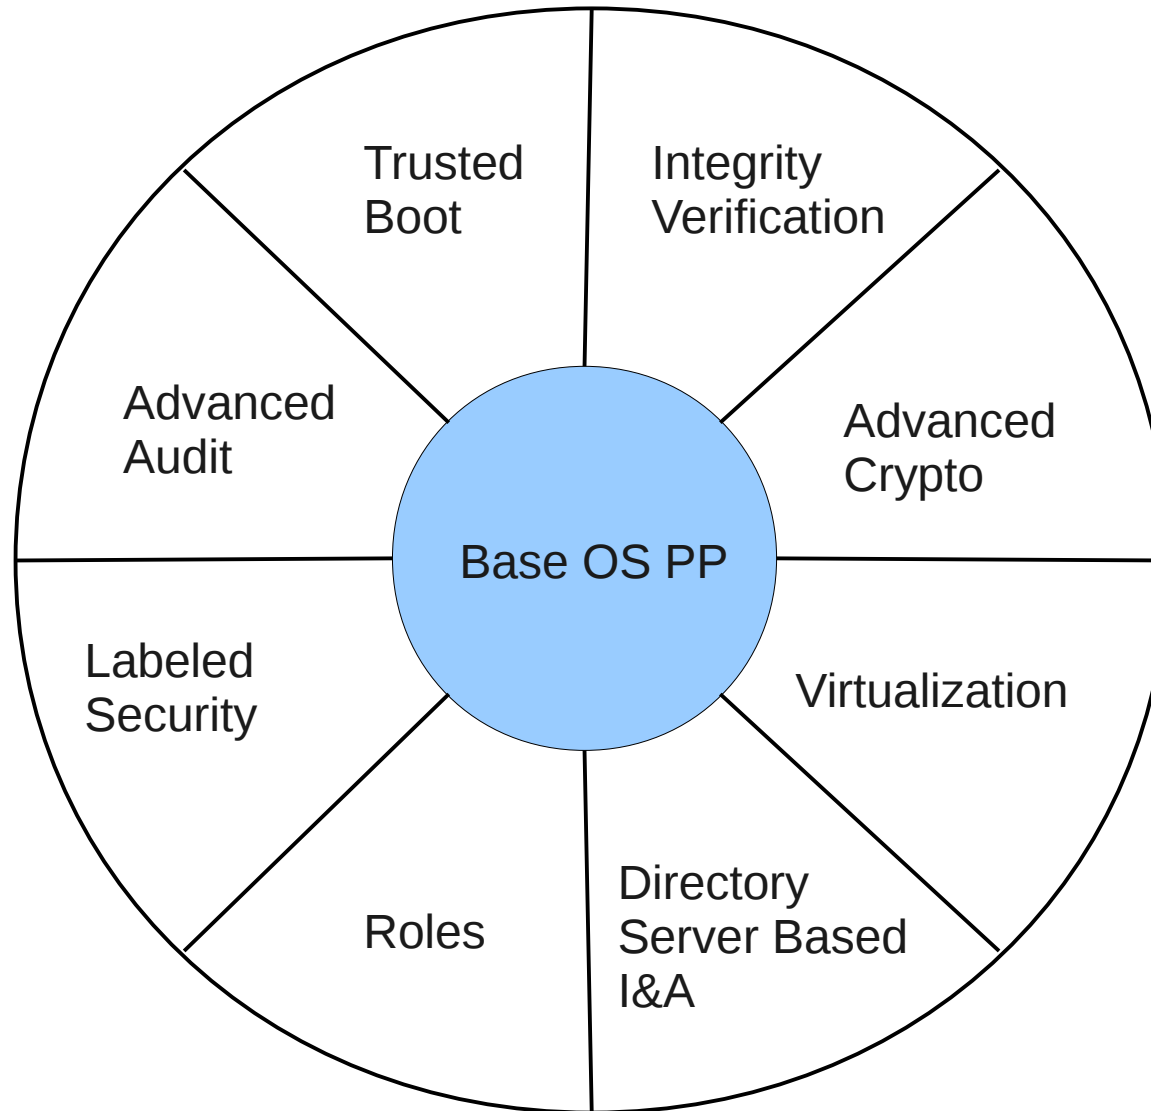

# Common Criteria

- RHEL5 was certified under LSPP at EAL4+
- No regressions in security features in RHEL6
- Challenges around protection profiles
  - NIAP – CAPP, LSPP, MRPP, GPOSPP
  - BSI - OSPP

# Common Criteria

**SUMMIT**

JBoss  
WORLD

PRESENTED BY RED HAT

# Common Criteria

- Base
  - Secure Attention Key
- Advanced Audit
  - Some updates regarding remote logging, performance on large files, and search by regular expression
- Advanced Crypto
  - Cryptography must be in separate address space from application that is using it.
- Virtualization
  - VM's must be separated by MAC or UID
  - Auditing: guest start/stop/pause/crash, change in resources, Qemu server accepting connections and authentication use
  - AMTU

# FIPS-140

- FISMA -> SP800-53 requires FIPS certified crypto mechanism
- RHEL5
  - Data at rest: kernel (dm-crypt)
  - Data in transit: openssl, libgcrypt, nss, openssh, openswan

# FIPS-140

- Libgcrypt needed strict FSM
- Integrity verification using sha256hmac
- Needed Power Up self tests in all places
- Needed Deterministic RNG in kernel
- Needed RNG test for duplicate answer
- Needed key zeroization in openssh / openswan
- Increased DSA key size for module verification
- Disallow some crypto algorithms in FIPS mode

# FIPS-140

- On RHEL5, to put into FIPS-140 mode, the crypto officer must regenerate the initrd using the following command:
  - `mkinitrd --with-fips -f /boot/initrd-$(uname -r).img $(uname -r)`
  - Add “fips=1” to grub kernel boot line
  - Reboot
- To verify FIPS mode:
  - `cat /proc/sys/crypto/fips_enabled`
- Some other cautions in Security Policies – please read them

# FIPS-140

- 2010 brings some changes (SP800-57 part1)
  - Ssh v2 protocol is no longer allowed as key distribution method
  - Diffie-Hellman key exchange must have self test
  - 112 bits of entropy required in RNG
  - Recommended key sizes almost double 1024->2048
  - Recommends some algorithms be replaced:
    - 2 key Triple DES -> 128 bit AES
    - SHA1 -> SHA2

# FIPS-140

- Other crypto changes: GPOSPP, FIPS-140-3
  - Audit requirements
  - Non-debugability
  - No implementations in scripting languages
  - Separation of application and key material

# Odds and Ends

- Added pam\_ssh\_agent\_auth for remote use of smartcards
- Added scrub for secure disk erasing
- NetworkManager and Openswan integration
- Key Escrow system for encrypted disk partitions
